LAB EVALAUTION

CASE STUDY: ALL THE QUESTIONS ARE COMPULSORY

Q1. USING ML-OPS, BUILD A python snippet/ ML BASED MODEL THAT UNDERGOES THE PROCESSES USING GIT, DOCKER AND JENKINS **(25)**

PERFORM USING THE SCREEN SHOT OF YOUR ACCOUNT LOGIN

Create a local git repository
Commit the initial code
Update the code on the remote server. Also perform some changes on remote n reflect the same on local.
Use git commands to
to create branches in git
diff between branches
logs of the commit
Revert of changes

SHARE NECESSARY SCREENSHOTS OF COMMANDS ASKED.

Deploy your application script in the Docker. And register ur image
Deployed image
Build/ dockerfile

Automate the build using Build Triggers w.r.t SCM (Git)
Create a Repository on Git and connect the created branch b1/master with the Jenkins and ensure the automation on the build initiated periodic triggers via any changes pushed to the github.[console o/p, configure, build]
==

Finally, pipeline the Model using the JENKINS pipeline configuration for the above stages mentioned

SHARE THE SCREENSHOT OF YOUR DOCKER ACCOUNT TO REPRESENT THE IMAGE BUILD in today's instance. ALSO SHARE NECESSARY SCREENSHOTS OF COMMANDS ASKED.
